ANTIBACTERIAL POTENTIALS OF ACTINOMYCETES ISOLATED FROM AQUATIC ENVIRONMENT

Abstract

Screening and isolation of promising strains of novel actinomycetes with potential antibiotic is still a thrust area of research because in recent time, many pathogenic bacteria are resistant to currently available antibiotics. Forty four actinomycetes from five water samples have been isolated. These isolates were screened for antagonistic potentiality against multiple drug resistant gram negative bacteria. Further five potent actinomycetes were screened out by secondary screening on the basis of the production of antibacterial spectrum against ten bacterial test cultures. Antibacterial substances were extracted from fermentation broth by the process of solvent extraction. Solvent system has been established for extraction and separation of antibacterial substance. Antibacterial activities of the extracts were performed using well diffusion method. The current investigation reveals that fresh water actinomycetes isolates can acts as potent source for novel antibacterial compounds against test bacteria.

Introduction

According to the World Health Organization, antibiotic resistance against many bacterial pathogens have been increased due to over-usage and the improper use of antibiotics. Nowadays multi drug resistant strains of pathogens are emerging more quickly than the rate of development of new antibiotics. Recently, methicillin and vancomycin resistant *Staphylococcus aureus* and penicillin resistant *Streptococcus pneumoniae* has been reported. To overcome this problem, scientists and pharmaceutical industries trying to perform new screening methods for the discovery of novel actinomycetes from untouched habitats. Novel actinomycetes must be better option for the finding of bioactive substances against resistant pathogens. In recent years, there has been a growing awareness of the potential value of aquatic microbes as a source of actinomycetes that produce secondary metabolites as a source of antibiotics. This work investigates the antimicrobial potential of actinomycetes which were isolated from water samples.

Material Method

Actinomycetes

Water samples were collected from different freshwater systems. Water samples were spread over on Starch casein agar (3) the inoculated plates were incubated at 28 °C for 7 days. and extraction of secondary metabolites. Inoculate isolated this medium incubated at 37 °C for 5 to 6 days on rotary shaker flask. Then the culture broth was centrifuged at 4000 rpm for 20 min. The supernatant was used for antibacterial activity. Antibacterial activities were performed using well diffusion method against the test organisms.

Test organisms: *E. coli*, *Pseudomonas aeruginosa*, *Staphylococcus aureus*, *Klebsiella pneumoniae*, *Salmonella typhi*.

Extraction of Antibacterial Compound

All isolated actinomycetes species (44) from fresh water showing antibacterial activity against all test organisms. Among these 44 actinomycetes these five potential actinomycetes were selected based on their performance in the preliminary screening test for production of antibacterial compounds and were used for the fermentation study. The five selected strains were A1 (*Streptomyces*), V1 (*Micromonospora*), S1 (*Streptomyces*), P1 (*Nocardia*), D3 (*Micromonospora*).

Antibacterial compound was purified from the filtrate by solvent extraction method. Ethyl acetate was added to the filtrate in ratio of 1:1 (v/v) and shaken vigorously for 1 h. complete solvent extraction. The ethyl acetate phase contains antibiotic substances separated from the aqueous phase it was evaporated to dryness. The crude extract obtained from each isolate were dissolved in methanol and used as stock concentration for determination of antimicrobial activity against test pathogens.

Antibacterial activities of Crude extract.

Antibacterial activities of extracted compound determine by Agar well diffusion method against the test organisms.

Result

The results showed that all the isolates actinomycetes were able to inhibit test culture. Table 1: Antibacterial activity antibiotic crude extract against multiple drug resistant bacteria.

Strain no.	Name of Actinomycetes	<i>E. coli</i>	<i>Pseudomonas aeruginosa</i>	<i>Staphylococcus aureus</i>	<i>Klebsiella pneumoniae</i>	<i>Salmonella typhi</i>
A1	<i>Streptomyces</i>	17	10	10	10	10
V1	<i>Micromonospora</i>	17	10	10	10	10
S1	<i>Streptomyces</i>	20	20	NH ₂	12	10
P1	<i>Nocardia</i>	15	20	20	18	20
D3	<i>Micromonospora</i>	10	16	10	30	10

*NH₂ = No Growth of test organism.

Conclusion

All isolated actinomycetes species (44) from fresh water showing antibacterial activity against all test organisms. From these five actinomycetes (P1, S1, A1, D3, V1) maximum antibacterial activity. So it is concluded that freshwater environment is a potential source of novel antibiotics compound. The outcome of this finding may give direction for researchers and for future clinical importance against multi drug resistant pathogens. This study has shown that freshwater environment could serve as good source of actinomycetes of antimicrobial importance with varying spectra of activities. Future work:- 1) Large scale fermentation and further purification, structure characterization are recommended to know the quality novelty, and 2) To observe antibiotics activity against super bug, multiple drug resistant.

Introduction

Bicyclic oxygen heterocycles resulting from fusion of benzene ring with 5,6-positions of either 4H-pyran ring system are designated as 2H-chromene (2H-1-benzopyran) and 4H-chromene (4H-1-benzopyran). Chromene nucleus is a versatile source of biologically active molecules which possess a wide range of pharmacological activities. It is the component of various naturally occurring compounds such as alkaloids, flavonoids, terpenoids and anthocyanins. Chromocarpin was first found during a study of plants in the Belgian Congo as yellow crystals from the ether extract of seeds and Chromocarpus Scriverius.

Significance

Many naturally occurring chromenes present an interesting range of biological activities. Several chromenes have been isolated from various sources such as -

Enzyme Activity Of Fresh Water Actinomycetes

Introduction

Actinomycetes are well known source of secondary metabolites. Aquatic environment represents a largely untapped source for isolation of new microorganisms with potential to produce biologically active secondary metabolites. Several species have been isolated and screened from various aquatic habitats in the past decades. Consequently the chances of isolating a novel strain of actinomycetes which could provide novel bioremediation has considerably reduced. However there is still an urgent need for discovering novel efficient enzymes in various applications. Actinomycetes produce several enzymes, degrading complex organic materials in soil or sediments such as proteinase, cellulase, amylase, gelatinase, keratinase and urease. Actinomycetes have been a source of enzymes for waste food processing, also seem to be very promising as immobilized preparations for routine clinical diagnostic tests, detergent, textile, pulp and paper industries, organic synthesis and biolysis industries.

Material and method

Actinomycetes strain were isolated from fresh water environment. The actinomycetes isolates suitable medium, by spot inoculation method, to screen their enzyme activities. 15 pure strain actinomycetes were selected and identified on the basis of morphological characteristics and spore morphology by using cover slip method.

The actinomycetes isolates were inoculated on suitable medium by spot inoculation method to screen their enzyme media as criteria for enzyme activities are given in following Table.

Sl.No	Enzyme	Medium	Inoculation days	Criteria For Positive Enzyme Activity
1.	Cellulase	Carboxy Methyl Cellulose (CMC) agar	7days	Clear zone around the colony after flooding with 2% valine
2.	Protease	Casein hydrolysis agar	7days	Clear zone around the colony after flooding with Congo red solution
3.	Urease	Urea hydrolysis agar	7days	A zone of clearing was observed around isolate colonies
4.	Caseinase	Casein agar	7days	Opaque (cloudy) zone around the colony
5.	Cellulase	Cellulose agar	7days	Clear zone around the colony after flooding with 1.5% valine

Result

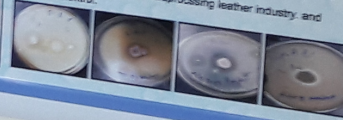

Enzymatic activities of 15 identified actinomycetes isolates were performed and results are given in table 1. It was found that out of 15 identified isolates actinomycetes were belonging to Streptomyces, Micromonospora, Streptomyces, Nocardia respectively.

Conclusion

Aquatic Actinomycetes are one of the most efficient groups of microorganisms in terms of producing commercially important bioactive compounds such as enzymes. Studies in recent years showed that the existence of actinomycetes from aquatic habitats is the unexplored aquatic habitat. Among producers of new secondary metabolites that show a range of biological activities enzyme production.

Future work

- 1) Enzyme purification.
- 2) Application in detergents, food processing, leather industry, and pollution control.

Streptomyces

Streptomyces is a genus of Gram-positive bacteria, belonging to the phylum Actinobacteria. It is the largest genus of bacteria, with over 200 species. Streptomyces are known for their ability to produce a wide variety of secondary metabolites, including antibiotics, antifungals, and immunosuppressants. They are also known for their ability to degrade complex organic materials, making them important in bioremediation and the production of biofertilizers.

Streptomyces are typically found in soil and aquatic environments. They are characterized by their filamentous growth habit, which often forms a network of branching filaments. The filaments are typically 1-2 micrometers in diameter and can grow up to 100 micrometers long. The filaments are often covered in a layer of mucus, which helps them to adhere to surfaces and form a biofilm.
